

8. Monoalphabetic Cipher using Keyword "CIPHER"

The image shows a code editor window with a file named 'main.c'. The code implements a monoalphabetic cipher using the keyword 'CIPHER'. It includes `<stdio.h>` and `<ctype.h>`. The `main` function prompts the user to enter plain text, which is then encrypted using a key derived from the keyword 'CIPHER' and the alphabet. The output shows the plain text 'hello' being encrypted to 'BEJJM'. A 'Run' button is visible above the output pane, which displays the execution results.

```
main.c
1  #include<stdio.h>
2  #include<ctype.h>
3
4  int main()
5  {
6      char plain[100];
7      char key[]="CIPHERABDFGJKLMNOQRSTUVWXYZ";
8      int i;
9
10     printf("Enter Plain Text : ");
11     scanf("%s",plain);
12
13     printf("Cipher Text : ");
14
15     for(i=0;plain[i]!='\0';i++)
16     {
17         char ch=toupper(plain[i]);
18         printf("%c",key[ch-'A']);
19     }
20
21     return 0;
22 }
```

Run

Output

Enter Plain Text : hello
Cipher Text : BEJJM
